Technology for Communications Professionals, Volume II - High-Speed Access and Multimedia Streaming Walt Mansell

This second volume in the Technology for Communications Professionals set is entitled High-Speed Access and Multimedia Streaming. This volume examines the local loop access technologies to raise the bandwidth requirements of today's communications network in support of multimedia services. We discuss DSL options and passive networks. In the second part of this book, we examine compression and quality of service techniques to support the simultaneous delivery of voice, data and video streams over the local loop network. We encourage all to focus and complete the exercise questions. The answers are in the back of the book. The time required to complete these questions is minimal and they help you determine your understanding of the topics. Technology for Communications Professionals is a three-volume set designed to provide the Communications Professional with a foundational knowledge of the technology used to enable communications on the public network. The intent of this series is to provide the fundamental concepts and functions upon which communications products and services will operate over the next several decades. The intervention of the Internet and packet-based networks has tipped the legacy telecom business on it's head. The next generation network transitions from a synchronous, big-system hardware-oriented network consisting of a complex core supporting simple end-user devices (telephone) to an asynchronous, software-oriented distributed processing network, simple core which relies on complex end-user devices (computer).
